Arithmetic and Geometric Progression

Quantitative Aptitude & Business Statistics
Sequence

- An arrangement of numbers in a definite order according to some rule is called a sequence.
- The various numbers occurring in a sequence are called its terms. We denote the terms of a sequence by $a_1$, $a_2$, $a_3$,... etc.
- The $n$th term $a_n$ called general term.
A sequence has finite or infinite according to its finite or infinite terms.

Example; 1

1, 3, 5, .... is an infinite sequence

Whose nth term is given formula

\[ t_n = 2n - 1 \]
Series

- A Series is obtained by adding all the terms of a sequence.

Example

1. $1+3+5+9+\ldots$ is an infinite series

2. $2+4+6+8+10+12$ is a finite series
Progressions

- If the terms of the sequence follow certain pattern, then the sequence is called a progression.
Example: 2

1, 1/2, 1/3, ... is an infinite sequence where nth term is given by formula
\[ a_n = \frac{1}{n} \]

Example: 3

2, 4, 6, 8, 10, 12 is a finite sequence in which each term is obtained by
adding 2 to the previous term
Arithmetic Progression(A.P)

- A sequence whose each term is obtained adding a fixed number to its term, the term is called common difference of the A.P.
The first in AP is ‘a’ and common difference is ‘d’

An arithmetic progression is a progression in which any term minus its previous terms is a constant.

\[ T(n+1) - T(n) = \text{common difference} \]
Examples

- 2, 7, 12, 17, 22, 27, ... is an A.P.
- 2, 4, 8, 12,...is NOT an A.P.

\[ t(n) = a + (n-1)d \]

General term
Arithmetic means

The intermediate terms between two terms of an arithmetic progression are called arithmetic means between the two terms.
Example

<table>
<thead>
<tr>
<th>Progression</th>
<th>Between</th>
<th>Arithmetic means</th>
</tr>
</thead>
<tbody>
<tr>
<td>2, 3, 4, 5, 6, ...</td>
<td>2, 6</td>
<td>3, 4, 5</td>
</tr>
<tr>
<td>2, 5, 8, 11, 14, ...</td>
<td>2, 11</td>
<td>5, 8</td>
</tr>
</tbody>
</table>
If \( a \) is first term and ‘\( d \)’ is common difference of an A.P, then \( n \) th term of an AP is denoted by

\[ t_n = a + (n-1)d \]
Sum of terms Arithmetic Series

For an arithmetic progression,

\[ S(n) = \frac{n}{2} [2a + (n - 1)d] \]

If we use \( l \) to represent the last term, \( T(n) \)

\[ S(n) = \frac{n}{2} (a + l) \]
Properties AP

1. If a constant is added or subtracted from term of an AP, then the resulting sequence is also in AP with same common difference.
2. If each term of an AP is multiplied or divided by non-zero constant $k$, then the resulting sequence is also in AP with common difference $kd$ or $d/k$. 
3. If $a_1, a_2, a_3, \ldots$ and $b_1, b_2, b_3, \ldots$ are two arithmetic progressions, then the sequence $a_1+b_1, a_2+b_2, \ldots$ is also in AP.

4. In a finite A.P, the sum of terms equidistant from the beginning and end is always the same and is equal to the sum of first and last.
5. Three numbers $a, b, c$ are in A.P if $2b = a + c$
1. Sum of the first $n$ natural numbers

$$\sum n = \frac{n(n + 1)}{2}$$
2. Sum of the Squares of first $n$ natural numbers

\[ \sum n^2 = \frac{n(n + 1)(2n + 1)}{6} \]
3. Sum of the Cubes of first \( n \) natural numbers

\[
\sum n^3 = \left( \frac{n(n + 1)}{2} \right)^2
\]
Problem ;1

- Find the value of k for the series 3k+4, 3k-7, k+12 an arithmetic sequence

Solution

If a, b, c are in A.P then 2b = a + c

2(3k-7) = 2k+4 = k = 12

6k-14 = 3k+16; K = 10
Problem ;2

Find the arithmetic mean between 7 and 15

Here a=7 and b =15

The arithmetic mean between a and b is

\[
\frac{a + b}{2} = \frac{7 + 15}{2} = \frac{22}{2} = 11
\]

The required arithmetic mean = 11
Problem ;3

- Insert 4 arithmetic means between 4 and 29
- Solution:
- If $d$ is the common difference, then

\[
d = \frac{b - a}{n + 1} = \frac{29 - 4}{5} = 5
\]
The arithmetic means are 4+5, 4+2*5, 4+3*5 and 4+4*5.

i.e 9, 14, 19 and 29
Problem 4

The Tenth term of an arithmetic progression is 25 and fifteenth term is 40. Find the first term and common difference and the find the fifth term.
Solution

- $t_{10} = 25$  $t_{15} = 40$ , where $t_n$ denotes the $n$th term.

- By using arithmetic progression.

- $T_n = a + (n-1)d$ , where
  - $a$ = first term and
  - $d$ = common difference
It is given that

1. \( 25 = a + 9d \)  
2. \( 40 = a + 4d \)

From 1 and 2, we get

1. \( 5d = 15 \) ; \( d = 3 \)
2. \( a = -2 \), hence \( t_n = -2 + (n-1) \times 3 \)
3. \( t_5 = -2 + 4 \times 3 = 10 \)
Problem 5

The Third term of arithmetic progression is 7 and its seventh term is 2 more than twice of its third term. Find the first term, common difference and the sum of first 20 terms of the progression.
Let the A.P be \( a, a+d; a+2d \)

........+...... .... \( a+(n-1)d \); \( a \) being first term and \( d \) the common difference.

According to the question \( t_3 = 7 \)

i.e  \( a+(3-1)d=a+2d=7 \)

\[ t_7 = 2+3t_3 \]

\[ a+6d = 2+3(7)=2+21=23 \]
a + 6d = 23

Solving 1 and 2: d = 4 and a = -1

Also Sum of 20 terms

\[ S_{20} = \frac{20}{2} \{20 \cdot (-1) + (20 - 1) \cdot 4\} \]

\[ = 10(-2 + 76) = 10 \times 74 = 740 \]
Problem 6

- Find the increasing arithmetic progression, the sum of first three terms is 27 and sum of their squares is 275.
- Let the first three terms of the progression be a-d, a and a +d
By the description of the problem

\[(a-d) + a + (a+d) = 27 \quad \text{1}\]

and

\[(a-d)^2 + a^2 + (a+d)^2 = 275 \quad \text{2}\]
- From 1 \[ 3a = 27 \text{ and } a = 9 \]
- From 2 \[ 3a^2 + 2d^2 = 275 \]
  \[ 2d^2 = 275 - 3 \times 81 = 275 - 248 \]
  \[ d = \pm 4 \]
- Using \( a = 9 \) and \( d = 4 \), we get required increasing arithmetic progression
- \( 9 - 4, 9, \text{ and } 9 + 4 \) i.e. \( 5, 9, \text{ and } 13 \)
Problem ;7

- Find the Sum of all numbers between 100 and 1000 which are divisible by 13.
- The numbers divisible by 13 for an arithmetic series. The series starts at 104 and ends at 988.
- The term is $a+(n-1)d$ where $a=104$, $d=13$. 
988 = 104 + (n - 1)3 = n = 69

Sum of these numbers is given by 37,674
Problem 8

- The sum of first \( n \) terms of an AP is

\[ 3n^2 - 2n + 1 \]

- The common difference is
The sum of n terms is

\[ 3n^2 - 2n + 1 \]

Putting n=1 then \( S_1 = 2 \)

Putting n=2 then \( S_2 = 9 \)

Second term is therefore

\[ = 9 - 2 = 7 \]

And common difference

\[ = 7 - 2 = 5 \]
Problem 9

Show that the sum of an AP, whose first term is ‘a’ and the second term is ‘b’ and the last term is ‘c’, is equal to

\[
\frac{(a + c)(b + c - 2a)}{2(b - a)}
\]
Solution

- **Common difference** \( d = b - a \)
- **Last term** \( C = a + (n-1)(b-a) \)
\[
\frac{c - a}{b - a} = n - 1
\]

\[
n = 1 + \frac{c - a}{b - a}
\]

\[
= \frac{b + c - 2a}{b - a}
\]

\[
S_n = \frac{n}{2} (a + c) = \frac{(b + c - 2a)}{2(b - a)} (a + c)
\]
Geometric progression

A geometric progression is a progression in which the ratio of each term to the preceding term is a constant.

\[ T(n+1):T(n) = \text{Common Ratio} \]
Geometric mean

The intermediate terms between two terms of a geometric progression are called geometric means between the two terms.
Examples

- 2, 4, 8, 16, ... is a G.P.
- 2, 4, 6, 8,... is NOT a G.P.

\[ t(n) = ar^{n-1} \quad \text{General term} \]
Example

<table>
<thead>
<tr>
<th>Progression</th>
<th>Between</th>
<th>geometric means</th>
</tr>
</thead>
<tbody>
<tr>
<td>2, 4, 8, 16, 32, ...</td>
<td>2, 32</td>
<td>4, 8, 16</td>
</tr>
<tr>
<td>1, -3, 9, -27, 81, ...</td>
<td>1, -27</td>
<td>-3, 9</td>
</tr>
<tr>
<td>4, 16, 64, 256, 1024, ...</td>
<td>4, 1024</td>
<td>16, 64, 256</td>
</tr>
</tbody>
</table>
Geometric Series

Sum of n terms in Geometric Series

- \( r < 1 \)
  \[ S_n = a \left(1 - r^n\right) \frac{1}{1 - r} \]

- \( r > 1 \)
  \[ S_n = a \left(r^n - 1\right) \frac{1}{r - 1} \]
Sum of G.P. find Applications in Mortgage or Installments Payment Calculation

Formula for Compound Interest Growth

\[ A = P (1 + r\%)^n \]

Formula for Depreciation

\[ A = P (1 - r\%)^n \]
Sum to infinity of a Geometric Series

\[ S(n) = \frac{a(1 - R^n)}{1 - R} \rightarrow \frac{a}{1 - R} \quad \text{(provided \ -1 < R < 1)} \]

as \( n \rightarrow \infty, R^n \rightarrow 0 \)

The sum to infinity \( S(\infty) = \frac{a}{1 - R} \)
Problem :1

- Find the GP whose 4\textsuperscript{th} term is 8 and 8\textsuperscript{th} term is 128/625.
- Solution: if \( a \) is the first term and \( r \) is the common ratio of GP,
- then \( 8 = t_n = ar^3 \) and \( t_8 = ar^7 = 128/625 \)
- \( r = \pm 2/5 \)
- $r = \frac{2}{5}$ then $a = 125$
- $r = -\frac{2}{5}$ then $a = -125$
- Required GP is either $125, 50, 20, 8, 16/5$
- or $-125, 50$ and $-20, 8, -16/5$
Problem 2

- Find the geometric mean between 3 and 27
- Solution: here $a = 3$ and $b = 27$
- The geometric mean between $a$ and $b$ is $= 9$
Problem ;3

- **Insert 3 geometric means between 1/9 and 9.**

- **Solution :** if n geometric means are to be inserted between a and b, then the common ratio r is given by

\[
 r = \left( \frac{b}{a} \right)^{1 \over n+1}
\]
Here \( r = \frac{1}{a} \) and \( b = 9 \) \( n = 3 \)

\[
r = \left( \frac{9}{\frac{1}{9}} \right)^{\frac{1}{4}} = \pm 3
\]

The required geometric means are

\( \frac{1}{3}, 1, 3 \) and \(-\frac{1}{3}, 1, -3\)
Problem 4

- Find three numbers in GP whose sum is $\frac{57}{2}$ and whose product is 729.

- Let the three numbers be $\frac{a}{r}$, $a$, $ar$

- Given $\frac{a}{r}$, $a$, $ar=729$

- $a^3=729= a=9$

- It is also given that $\frac{a}{r} + a + ar = \frac{57}{2}$
- \( r = \frac{2}{3}, \frac{3}{2} \)
- Therefore, the required numbers are \( \frac{27}{2}, 9, 6 \) or \( 6, 9, \frac{27}{2} \)
Problem 5

Find the following missing numbers on using suitable formula give sum of the following:

1 + 3 + 9 + * + 81 + 243 + * + 2187
Solution

- Given

\[ 1 + 3 + 9 + \ldots + 81 + 243 + \ldots + 2187 \],

We may write the sum

\[ S = 1 + 3 + 3^2 + \ldots + 3^4 + 3^5 + \ldots + 3^7 \]

Number of terms = 8 and the series is in GP, with common ratio 3

\[ t_4 = 1 \times 3^3 = 27 \]

the seventh term = \[ 1 \times 3^6 = 726 \]
• **Required missing numbers are 27 and 729**
• **And the Sum S=3280**
Problem 6

- If \( \frac{1}{x+y}; \frac{1}{2y}; \frac{1}{y+z} \) are in AP. Then prove that \( x, y, z \) are in GP.

- Solution: Since \( \frac{1}{x+y}; \frac{1}{2y}; \frac{1}{y+z} \) are in AP.
Solution

\[
\begin{align*}
\frac{2}{2y} &= \frac{1}{x+y} + \frac{1}{y+z} \\
\frac{1}{y} &= \frac{(y+z) + (x+z)}{(x+y)(y+z)} \\
xz &= y^2 \\
\frac{y}{x} &= \frac{z}{y}
\end{align*}
\]

Thus \(x, y\) and \(z\) are in GP
Problem : 7

Find the Sum of the Series

\[ 3 + 33 + 333 + \ldots \ldots + \text{to n terms} \]

Solution:

\[ S_n = 3 + 33 + 333 + \ldots \ldots + \text{to n terms} \]
\[ = 3(1 + 11 + 111 + \ldots \ldots + \text{to n terms}) \]
\[ = 3/9(9 + 99 + 999 + \ldots \ldots + \text{to n terms}) \]
\[
\frac{1}{3} \left\{ 9 + 99 + 999 + \ldots \ldots \text{n terms} \right\} \\
= \frac{1}{3} \left\{ (10 - 1) + (10^2 - 1) + (10^3 - 1) + \ldots \ldots \text{ton} \ldots \right\} \\
= \frac{1}{3} \left[ (10 + 10^2 + 10^3 \ldots \ldots + 10^n) - n \right] \\
= \frac{1}{3} \left[ \frac{10(10^n - 1)}{10 - 1} - n \right] \\
= \frac{10}{27} \left[ 10^n - 1 \right] - \frac{n}{3}
\]
Problem 8

- Find the Sum of the Series
  \[0.8 + 0.88 + 0.888 \ldots \ldots + \text{to n terms}\]

Let \( S_n \) be the Sum of the first \( n \) natural numbers

Solution

\[ S_n = 0.8 + 0.88 + 0.888 \ldots \ldots + \text{to n terms} \]

\[ = 8(0.1 + 0.11 + 0.111 + \ldots + \text{to n terms}) \]

\[ = \frac{8}{9}(0.9 + 0.99 + 0.999 + \ldots + \text{to n terms}) \]
\[
\begin{align*}
8 \left\{ .9 + .99 + .999 + \ldots \ldots \text{nterms} \right\} \\
= \frac{8}{9} \left\{ (1 - \frac{1}{10}) + (1 - \frac{1}{10^2}) + (1 - \frac{1}{10^3}) + \ldots \ldots \right\} \\
= \frac{8}{9} \left[ n - \left( \frac{1}{10} + \frac{1}{10^2} + \frac{1}{10^3} + \ldots \ldots \right) \right] \\
= \frac{8}{9} \left( n - \frac{1}{10} \times 9 \left( \frac{10^n - 1}{10^n} \right) \right) \\
= \frac{8}{9} \left( n - \frac{1}{9 \times 10^n} (10^n - 1) \right)
\end{align*}
\]
Example: 9

- By Expressing as an infinite geometric series find the value of 0.2175

- Solution

\[ 0.2175 = 0.2175757575 \ldots \]

\[ = 0.21 + 0.0075 + 0.000075 \]
\[ + 0.00000075 + \ldots \]
\[
= 0.21 + \frac{75}{10^4} + \frac{75}{10^6} + \frac{75}{10^8} + \ldots \ldots \\
= 0.21 + \frac{75}{10^4} \left( 1 + \frac{1}{10^2} + \frac{1}{10^4} + \frac{1}{10^8} + \ldots \ldots \right) \\
= 0.21 + \frac{75}{10^4} \left( \frac{1}{1 - \frac{1}{10^2}} \right) \\
= 0.21 + \frac{75}{10^4} \times \frac{100}{99} \\
= \frac{359}{1650}

C) 2, 5, 8
D) none of these
12. The sum of all odd numbers between 100 and 200 is

A) 6200
B) 6500
C) 7500
D) 3750
12. The Sum of all odd numbers between 100 and 200 is

- A) 6200
- B) 6500
- C) 7500
- D) 3750
13. Which term of the AP 64, 60, 56, 52…. is Zero

A) 16
B) 17
C) 15
D) 14
13. Which term of the AP 64, 60, 56, 52…. is Zero

A) 16
B) 17
C) 15
D) 14
14. The product of 3 numbers in GP is 729 and the sum of squares is 819. The numbers are

A) 9, 3, 27
B) 27, 3, 9
C) 3, 9, 27
D) none of these
14. The product of 3 numbers in GP is 729 and the sum of squares is 819. The numbers are

A) 9, 3, 27
B) 27, 3, 9
C) 3, 9, 27
D) none of these
15. If the first term of a GP exceeds the second term by 2 and the sum of infinity is 50 then the series is

A) 10, 8, 32/5, ….
B) 10, 8, 5/2, ….
C) 10, 10/3, 10/9, ….
D) none of these
15. If the first term of a GP exceeds the second term by 2 and the sum of infinity is 50 then the series is

A) 10, 8, 32/5, ....
B) 10, 8, 5/2, ....
C) 10, 10/3, 10/9, ....
D) none of these
THE END

Arithmetic and Geometric Progression
